

REMARKS

Applicant disagrees that its invention discloses and claims two separate species. The invention concerns a compressor machine which insures a precise orientation of shafts. The side wall of the cover has an opening sealed by a removable lateral cover. The cover does not in any way affect the mounting of the shafts. The invention allows that the tooth gears can be fitted to the shafts through openings in the housing cover; the bearing bores for the shafts can be produced and machined into one piece housing in a single set-up. All of the figures, including figure 6 read on these features. The fact that the body is surrounded by a hood such as shown in figure 6 does not alter the invention.

In accordance with the requirement of the action, Applicant elects, if its argument is rejected, to proceed with Figs. 1-5 which are readable on claims 12-16.
